

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claim 1 -6 (cancelled).

Claim 7 (previously presented): A universal ground clamp for structures with different cross-sectional shape, comprising:  
an elongated strap defining at least a first hole and a second hole; and  
a securing stud mechanism to extend through at least the first hole and the second hole to attach the elongated strap about the structure,  
the securing stud mechanism including a stud having a curved surface to engage the elongated strap with a smooth transition;  
the stud including a head and a shank, wherein the head includes the curved surface;  
the elongated strap including an abrasive surface for engaging an electrically conductive structure; and  
the abrasive surface including at least one projection formed by piercing the elongated strap with a pointed object having a pyramidal shaped point.

Claim 8 (previously presented): A universal ground clamp for structures with different cross-sectional shape, comprising:  
an elongated strap defining at least a first hole and a second hole; and  
a securing stud mechanism to extend through at least the first hole and the second hole to attach the elongated strap about the structure,  
the securing stud mechanism including a stud having a curved surface to engage the elongated strap with a smooth transition;  
the stud including a head and a shank, wherein the head includes the curved surface;  
the elongated strap including an abrasive surface for engaging an electrically conductive structure; and  
the abrasive surface including at least one projection formed by piercing the elongated strap with a pointed object, wherein the at least one projection includes jagged and torn edges.

Claim 9 (cancelled).

Claim 10 (previously presented): A universal ground clamp for structures with different cross-sectional shape, comprising:

an elongated strap defining at least a first hole and a second hole; and

a securing stud mechanism to extend through at least the first hole and the second hole to attach the elongated strap about the structure,

the securing stud mechanism including a stud having a curved surface to engage the elongated strap with a smooth transition;

the stud including a head and a shank, wherein the head includes the curved surface;

the elongated strap including an abrasive surface for engaging an electrically conductive structure;

wherein the stud is captured by at least the first hole and the stud is capable of being received by the second hole after the elongated strap has been positioned about at least a portion of an electrically conductive structure; and

wherein the first hole includes at least one projection extending into the first hole and the stud is captured within the first hole by the at least one projection.

Claim 11 (original): An electrical connector in accordance with Claim 10, wherein the at least one projection is integral to the elongated strap.

Claim 12 (original): An electrical connector in accordance with Claim 11, wherein the at least one projection has a rectangular shape and extends from the perimeter of the first hole and into the first hole.

Claim 13 (original): An electrical connector in accordance with Claim 10, wherein the at least one projection radially interferes with the stud and thereby captures the stud within the first hole.

Claim 14 (original): An electrical connector in accordance with Claim 13 wherein the stud includes a head and a shank and the at least one projection radially interferes with the shank.

Claim 15 (original): An electrical connector in accordance with Claim 14, wherein the shank includes a threaded portion and the at least one projection radially interferes with threads of the threaded portion.

Claim 16 (original): An electrical connector in accordance with Claim 14, wherein the shank includes a threaded portion and a non-threaded portion located between the head and the threaded portion and the at least one projection radially interferes with the non-threaded portion.

Claim 17 (original): A universal ground clamp for structures with different cross-sectional shape, comprising:

an elongated strap defining at least a first hole and a second hole; and

a securing stud mechanism to extend through at least the first hole and the second hole to attach the elongated strap about the structure,

the securing stud mechanism including a stud having a curved surface to engage the elongated strap with a smooth transition;

the stud including a head and a shank, wherein the head includes the curved surface;

the elongated strap including an abrasive surface for engaging an electrically conductive structure;

wherein the stud is captured by at least the first hole and the stud is capable of being received by the second hole after the elongated strap has been positioned about at least a portion of an electrically conductive structure; and

wherein the securing stud mechanism includes a sliding curved nut slidingly supported on the elongated strap.

Claim 18 (original): An electrical connector in accordance with Claim 17, wherein the elongated strap includes at least one ends stop and the sliding curved nut is maintained on the elongated strap by the at least one stop.

Claim 19 (original): An electrical connector in accordance with Claim 18, wherein the stud defines a hole coaxial with the longitudinal axis of the stud.

Claim 20 (original): An electrical connector in accordance with Claim 19, wherein the head defines a bore extending transversely to the longitudinal axis of the stud for receiving a ground wire.

Claim 21 (original): An electrical connector in accordance with Claim 20, wherein the bore extends completely through the head.

Claim 22 (original): An electrical connector in accordance with Claim 21, wherein the hole extends into the bore.

Claim 23 (original): An electrical connector in accordance with Claim 22, wherein the electrical connector includes a second stud and the hole receives the second stud.

Claim 24 (original): An electrical connector in accordance with Claim 23, wherein the second stud may be rotatably shifted from a wire receiving position to a wire securing position.

Claim 25 (original): An electrical connector in accordance with Claim 24, wherein the bore may receive a wire when the second stud is in its wire receiving position and a wire may be secured therein when the second stud is in its wire securing position.

Claim 26 (original): An electrical connector in accordance with Claim 23, wherein the second stud includes a frusto-conical end portion.

Claims 27-29 (cancelled).
